Furukawa – Hydraulic Crushers

The Hydraulic Crusher V series was designed to be light-weight, speedy and strong. They efficiently perform all operations, from dismantling concrete or steel frame structures and crushing objects into small pieces to collecting reinforcing steels. We offer a great variety of hydraulic crushers such as the Vs series for crushing objects into small pieces, the Vx/Vps series for crushing objects into large pieces, reinforcing steels cutter Vc series, and crushers with magnets for crushing objects into small pieces.

Primary Crushers

These are new type two-cylinder large crushers for crushing objects into large pieces. The use of highly strong abrasion-resistant steel casting in the frames, arms and brackets achieved a light-weight and strong body.

Secondary Crushers

These light-weight, speedy, strong, operator-friendly and easy-to-use hydraulic crushers take concrete crushed into large pieces and powerfully and speedily crush them into smaller pieces, easily separating reinforced steel from concrete pieces.

Cutters

These light-weight and strong multi-functional reinforcing steel cutters in ultra strong cast steel frames are capable of performing all the operations related to steel frame or concrete structure dismantling.
